TxDOT Executive Director

David S. Fulton
Director, Aviation Division
INTRODUCTION

The Texas Department of Transportation (TxDOT) offers the best wishes to you for safe and enjoyable flying to all our state's airports.

This directory contains aeronautical information for approximately 400 Texas airports that are open to the public.

Airports are listed alphabetically by city or town. The graphics are based on information obtained from the Federal Aviation Administration (FAA) facility records, airport owners and the TxDOT Aviation Division.

TxDOT cannot assume responsibility for information contained in this directory due to the constant changes in airport conditions, services, or for any actions taken by a pilot on the basis of this information.

We encourage pilots always to refer to the current FAA Airman's Information Manual, the Airport/Facility Directory, NACO Sectional Aeronautical Charts and NOTAMS. Contact the nearest Flight Service Station or airport operators to determine current airport conditions and available services, prior to each flight.

Fly safely and enjoy,

David S. Fulton
Director
Aviation Division

Office Location: TxDOT
Aviation Division
150 E. Riverside Drive
5th Floor, South Tower
Austin, Texas 78704

FIXED BASE OPERATOR: NONE
An automatic, remotely controlled, ground to ground communications device. Pilots at non-tower airports may contact the local Air Traffic Control (ATC) facility and / or Flight Service Station (FSS) by aircraft radio-to-telephone connection located on the airport. The telephone call goes to the appropriate FSS or sector ATC controller. Pilots may receive an instrument clearance, close a VFR or IFR flight plan, get an updated weather briefing prior to take off, or any other FSS or ATC services. Use the listed frequency for the airport (121.725 or 135.075). Activate the system with four “key clicks” on the VHF radio to contact the appropriate ATC facility or six “key strokes” to contact the FSS. There is timer on the modem connection. If no voice is heard for a preset time period, the system will disconnect. Note that the VHF transceiver on the airport is very low power, 2 - 5 watts. You may not be able to establish contact when between hanger rows or near other obstructions. Additionally, you may need to reposition your aircraft slightly when stopped on the taxiway. The GCO system is intended to be used only on the ground. Airports with GCO are noted in the text portion of the airport diagram. Look for additional GCO installations in Texas in the future. More information on GCO systems and their use is available at <www.arinc.com> search for ARRAS, or <www.avtech-marketing.com>

### SUMMARY OF RECOMMENDED COMMUNICATION PROCEDURES

<table>
<thead>
<tr>
<th>FACILITY AT AIRPORT</th>
<th>FREQUENCY USE</th>
<th>COMMUNICATION / BROADCAST PROCEDURES</th>

</tbody>
</table>

**COMMUNICATIONS**
Example:
40K. Wind 30° Angle
A. 30° angle between wind and nose
B. 40k total wind velocity
C. 35k headwind component
D. 20k crosswind component
Distances are in Nautical Miles along great circle and are given for preliminary planning purposes only. Do not use these distances for actual flight planning.
**Special Equipment Suffix**  
(Enter on Flight Plan - Block 3)

**CIVIL AIRCRAFT PILOTS:** FAR Part 91 requires you file an IFR flight plan to operate under instrument flight rules in controlled airspace. Failure to file could result in a civil penalty not to exceed $1,000 for each violation (Section 901 of the Federal Aviation Act of 1958, as amended). Filing of a VFR flight plan is recommended as a good operating practice. See also Part 99 for requirements concerning DVFR flight plans.

### Downed Aircraft & Emergency Frequency 121.5

Emergency locator transmitters broadcast on the 121.5 frequency. If you have a spare receiver it is suggested that you monitor this frequency. If you hear a sustained signal, a transmission, or suspect that an aircraft may be downed, contact the nearest FAA Flight Service Station or law enforcement office.

### Altitude & Distance

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
TO FIND THE EFFECT OF ALTITUDE AND TEMPERATURE

1. CONNECT THE TEMPERATURE AND AIRPORT ALTITUDE BY A STRAIGHT LINE
2. READ THE INCREASE IN TAKE-OFF DISTANCE AND THE DECREASE IN RATE OF CLIMB FROM STANDARD SEA LEVEL VALUES HERE

ADD THIS PERCENTAGE TO YOUR NORMAL TAKE-OFF DISTANCE

Example:

The diagonal line shows that 230% must be added for a temperature of 100° and a pressure altitude of 6,000 feet.

Therefore, if your standard temperature sea level take-off distance normally requires 1,000 feet of runway in order to climb to 50 feet, it would become 3,300 feet under the conditions shown.

In addition, the rate of climb would be decreased 76%. Therefore, if your normal sea level rate of climb is 500 feet per minute, it would become 120 feet per minute.
Daylight Saving Time Begins at 2:00 a.m.
the 2nd Sunday of March
Standard Time Begins at 2:00 a.m.
the 1st Sunday of November

Texas Time Zones
For Landings
1. Enter pattern in level flight, abeam the midpoint of the runway, at pattern altitude.

2. Maintain pattern altitude until abeam approach end of the landing runway, on downwind leg.

3. Complete turn to final at least 1/4 mile from runway. Make straight in approaches with caution, listen and announce intentions for take-offs on CTAF.

For Departures
4. Continue straight ahead until beyond departure end of runway.

5. If remaining in the traffic pattern, commence turn to crosswind leg beyond the departure end of the runway, within 300 feet below traffic pattern altitude.

6. If departing the traffic pattern, continue straight out, or exit with a 45 degree turn beyond the departure end of the runway, after reaching pattern altitude.

For Guidance
Fly traffic at 1000’ AGL unless otherwise established for the airport. If in doubt, request recommended traffic altitude on UNICOM.

Use left hand traffic pattern unless markings at windsock indicate right hand traffic.

CROSS-REFERENCE AIRPORT IDENT WITH CITY NAME USING THE TABLE ON THE PREVIOUS PAGE.
CROSS-REFERENCE AIRPORT IDENT WITH CITY NAME USING THE TABLE TWO PAGES PREVIOUS.
TEXAS AIRSPACE AT A GLANCE
DFW / HOUSTON Class B Airspace

- All aircraft must have an operable two-way radio capable of communications with Regional / Houston Approach Control (Approach) and other ATC agencies on appropriate frequencies for the DFW / HOU Class B airspace (FAR 91.131). All aircraft with electrical systems must have a transponder with altitude reporting (FAR 91.215).

- IFR aircraft must have a VOR, TACAN or RNAV system.

- Large (more than 12,500 pounds gross weight) turbine airplanes going to or from a primary airport for which a Class B airspace area is designated must operate within (not below) the Class B airspace while within the lateral limits of the class B airspace.

- Do not exceed 200 knots indicated airspeed when operating below the class B airspace.

- No student, recreational, or sport pilot operations to or from the airport. Student, recreational, or sport pilots must have specific training to operate in the class B airspace and other airports within the class B airspace (FAR 61.95). Note: private or higher rated pilots operating to sport pilot limits (without a medical) may operate in the class B airspace and to all airports within the class B airspace.

- A clearance must be issued by Approach prior to entry into the Class B airspace. If you are VFR, be sure Approach specifically clears you thus:

  Example (from Approach):
  
  "<your call sign> is cleared in the class bravo airspace..."

- If you intend to operate VFR in the VFR corridors through the class B airspace, contact Approach and state your intentions.

- Note that the minimum weather conditions for operations within the class B airspace are 3 sm visibility and clear of clouds. Within the VFR corridors you must remain 500 feet below, 1000 feet above, and 2000 feet horizontally clear of clouds with 3 sm visibility (FAR 91.155).
Class C Airspace

• Anytime you receive flight following services from any radar facility while you are VFR, you need not request permission for heading or altitude changes unless ATC has assigned such or request you advise them before changing.

• There are ten class C airports in Texas. Each class C Terminal Radar Approach Control (TRACON) has a letter of agreement with the adjacent Air Route Traffic Control Center in that the TRACON will deal with all traffic, IFR or VFR, out to 20 NM from the referenced airport(s) and up to approximately 10,000 above this expanded area. If you are within this airspace, call TRACON for services.

• All aircraft must have an operable two-way radio capable of communications with TRACON and other ATC agencies on appropriate frequencies for the class C airspace (FAR 91.130). All aircraft with electrical systems must have a transponder with altitude reporting (FAR 91.215).

• You must communicate with TRACON prior to entry into the class C airspace. This means TRACON must acknowledge your call sign: Example (from TRACON):
  "<your call sign>, roger"
  followed, or not, by specific instructions for heading, altitude, speed.
  TRACON will exclude VFR traffic thus:
  "<your call sign> (or all aircraft on this frequency) remain clear of the class C airspace until further notice”

• VFR, note that TRACON does not grant a specific entry clearance, but may issue a specific restriction NOT to enter. Sport pilots may not enter class C airspace unless they have specific training (FAR 61.325).

• VFR, if TRACON does not issue you a specific heading or altitude you may fly any necessary for your route of flight. You need not advise TRACON of any heading or altitude changes unless TRACON asks for this or assigns you a specific heading or altitude.

• If you depart from a non towered satellite airport within the class C airspace, contact TRACON as soon as practical after take off. If the satellite airport has a RCO or GCO, contact TRACON prior to departure.
Terminal Radar Service Areas (TRSA)

- There are two TRSA in Texas. TRSA are general controlled airspace, class E. VFR, you need not contact TRACON prior to entry or while in any TRSA, however it is recommended you do so. There are no specific equipment requirements to operate VFR in a TRSA.

- If you ask for and receive radar services from TRACON, you must comply with heading and altitudes assigned or cancel the service.

Special VFR Operations (FAR 91.157)

- An ATC clearance to operate within the lateral boundaries of surface based controlled air space up to 10,000 feet MSL when the weather is below VFR minimums.

- Fixed wing special VFR is NOT permitted at the following airports: Dallas Fort Worth (DFW), Dallas Love (DAL), and Houston Intercontinental (IAH).

- You must be at least a private pilot to request and receive special VFR. You may receive a special VFR clearance immediately before entering or immediately before taking off from surface based controlled air space. ATC will not offer special VFR, you must ask for it. ATC will not issue a specific altitude but may require you to remain below or above a given altitude. You are responsible for terrain clearance per FAR 91.119.

Example: "Cessna 1234ME is cleared through the class C air space. Maintain special VFR. Maintain at or below 4000 until clear of the class C airspace."

- Special VFR flights to or from non towered airports that have ASOS or AWOS weather reporting should advise the controlling ATC agency they have “one minute weather” and state their intentions prior to operations in controlled airspace. The above applies to all aircraft except helicopters. Helicopters must remain clear of clouds, with no visibility requirements. Notice that special VFR may only be used in controlled air space that is surface based. You may not operate special VFR in any controlled airspace that does not start at the surface. You must exit the surface based controlled air space into class G airspace and have 1 SM visibility and clear of clouds (fixed wing) or request and receive an IFR clearance, or meet the weather minimums for controlled airspace aloft. Also note that you may operate special VFR within the lateral boundaries of surfaced based controlled air space up to 10,000’ MSL, even if the upper limit of the surface based air space stops below 10,000’ MSL.

- Day, Fixed Wing: 1 SM visibility (reported ground visibility, if available, otherwise, flight visibility) and clear of clouds. Day, Helicopter: clear of clouds, no visibility limit.

- Night, Fixed Wing: 1 SM visibility and clear of clouds. The PIC must be instrument rated and current; the aircraft must be instrument capable and current. Night, Helicopter: clear of clouds, no visibility limit (FAR Part 91 operations only). The PIC must be instrument rated and current; the aircraft must be instrument capable and current.
Class D Airspace

- Airports with control towers have class D surface areas (FAR 91.129). You must communicate with the control tower prior to entry, as with class C airspace (see).

- When the tower is closed, the airport reverts to class E or G airspace.

- Tower controllers only sequence traffic for landing or takeoff. You are always responsible to separate yourself from other traffic. Note: tower may require you to extend downwind, reenter the traffic pattern, etc. This is for sequencing, not separation.

- You must comply with tower instructions while in the class D airspace. This includes taxiing, departing or arriving at the airport.

- Sport pilots may not enter class D airspace until they receive specific training (FAR 61.325).
